For those who haven't yet seen this, [.mario](#) and [christ1an](#) over at [sla.ckers](#) has been working on a PHP Intrusion Detection System and the results are fairly promising! The system is based on regular expressions and seems to catch everything I've jammed into it so far.

Here's an example of catching a JavaScript event handler:

rule: (on\w+\s*=.*\\?([\"|'|`])|\\>)?

rule-description: *detects possible event handlers*

impact: 4

Check out the [Google Group](#) and the [live sandbox](#) for more.
